

ABSTRACT OF THE DISCLOSURE

An Improved Method and System for Electronic Data Sales and Distribution over Wide Area Networks is disclosed. The preferred system and method divides the software or other data to be distributed into a separate licensing module and a program module, with each module being distributed separately. The preferred licensing module can be distributed by an e-commerce server over a wide-area network, while the program module is distributed by a separate server computer over the wide-area network (or other method). Furthermore, the software or other electronic data can be updated easily by simply updating the single repository of the program module, while leaving the licensing module(s) at each e-commerce server unchanged.
